FAQ: Why does the application show 'Total Annual Quantity' but ask for m^3/day in the add purpose screen for my purposes?

Question

Why does the field say **"Total Annual Quantity"** while the unit beside the field is **m^3/day**? Should I enter my annual volume or my daily volume?

Answer

Enter the value in the **unit displayed beside the field**.

Although the field is called **Total Annual Quantity**, the application expects the quantity to be entered in the units shown for your selected Purpose of Use (PUC).

- If the field shows **m^3/year**, enter your annual water quantity.
- If the field shows **m^3/day**, enter your average daily water quantity.

The "Total Annual Quantity" label refers to your annual water requirement, but the value entered must match the unit displayed by the application.

If you know your annual water volume

If the field requires **m^3/day**, convert your annual volume to a daily value by dividing by **365**.

Example

Annual water volume: 730 m^3/year

Calculation: 730 ÷ 365 = 2.0 m^3/day

Enter: 2.0 m^3/day

Seasonal water use

If you only use water during part of the year, first calculate your total annual water volume, then convert it to the required unit.

Example

2.0 m^3/day for 180 days/year

Annual volume = 2.0 × 180 = 360 m^3/year

Convert back to daily: 360 ÷ 365 = 0.986 m^3/day

Enter: 0.986 m^3/day

Question

How do I calculate Total Annual Quantity?

Answer

The application includes help text beside the field explaining how to calculate the value.

Note : The **annual irrigation requirement** should be based on the monthly Evapotranspiration (ET) values throughout the year, while the **system capacity** should be sized to accommodate the month with the highest demand— typically July.

Continuous water use (24 hours/day, 365 days/year)

Use the Online Unit Converter Tool to calculate the annual quantity from the maximum rate of diversion.

Water used less than year-round

Calculate the annual quantity manually using your maximum rate of diversion.

To calculate m^3/year

Maximum Rate of Diversion × 3600 × Hours of use per day × Days of use per year = Total Annual Quantity (m^3/year)

To calculate m^3/day

Maximum Rate of Diversion × 3600 × Hours of use per day = Total Annual Quantity (m^3/day)

Depending on the unit of your maximum rate of diversion, additional conversions may be required

(seconds, minutes, hours, days, or years).

Question

Why does the application work this way?

Answer

Different Purposes of Use (PUCs) require different reporting units. Some applications require m^3/year, while others (such as certain domestic water use

applications) require m^3/day. Always enter the quantity using the unit displayed beside the field.

Important

Always enter the value in the **unit shown next to the field**, even if the field label says **Total**

Annual Quantity. If your available data is in a different unit, convert it before entering the value.
